### **Summary of Investment Objective**

The Fund's investment objective is to achieve a combination of income and long-term capital appreciation, targeting a yearly average return of 3.5% (net of fees) over the Euro Interbank Offered Rate (EURIBOR) over a rolling three-year period. The Fund aims to achieve its objective with an annualised volatility ranging, under normal market conditions, between 5% and 8%. There is no guarantee that the Fund will achieve its return objective, nor that it will remain within the aimed-for volatility range.

Past performance is not an indicator or a guarantee of future performance. The value of shares in the fund and income received from it can go down as well as up, and investors may not get back the full amount invested. All performance data shown is in the currency stated, include reinvested dividends and are net of management fees. Sales charges and other commissions, taxes and other relevant costs paid by the investor are not included in the calculations. Performance may also be affected by currency fluctuations. Currency fluctuations may affect the value of overseas investments. The fund offers other share classes subject to different fees and expenses, which will affect their performance. Please see the prospectus for details. Up to date performance figures can be found on our local website.

References to indices are made for comparative purposes only and are provided to represent the investment environment existing during the time periods shown. When performance for either the portfolio or its benchmark has been converted, different foreign exchange closing rates may be used between the portfolio and its benchmark.

The past performance has been simulated. Please refer to the Important Information section at the end of this document for more information.

The W (Ydis) EUR share class launched on 04.09.2015. Performance data prior to that date is for the A (Ydis) EUR share class launched on 13.02.2006 which has higher annual charges.

Past performance is not an indicator or a guarantee of future performance.

Average Portfolio Exposure: The average economic exposure during the period for each particular strategy. Figures reflect certain derivatives held in the portfolio (or their underlying reference assets) and may not total 100% or may be negative due to rounding, use of any derivatives, unsettled trades or other factors.

<u>Performance Contribution:</u> Estimates what each position has contributed to the portfolio's total return. The sum of all estimates may differ from the portfolio's official top-level return due to several factors such as the difference between the actual trade price of securities included in performance and the end of day price used to calculate analytics.

#### Definitions

<u>Growth</u>: Growth strategies tend to have positive correlation to equity markets. These types of strategies aim to provide long-term capital growth driven from specific equity or fixed income markets. Such strategies are meant to find opportunities that are deemed to have good growth potential.

<u>Defensive</u>: Defensive strategies tend to have a negative correlation to equity markets. These types of strategies aim to minimise the risk of principal loss. Such strategies are meant to protect investors against significant losses from major market downturns.

<u>Stable</u>: Stable strategies tend to have low or no correlation to equity markets. These types of returns aim to offer consistently higher returns than money markets while taking on modestly higher amounts of risk. Such strategies are not dependent on strong or weak economic conditions to deliver positive returns and can act as a good diversifier.

Asset Class Exposure

Cash Offsets: Synthetic cash positions that are created when we use levered financial instruments (such as options and futures) to gain market exposure.

Momentum: The rate of acceleration of a security's price or volume. The idea of momentum in securities is that their price is more likely to keep moving in the same direction than to change directions. In technical analysis, momentum is considered an oscillator and is used to help identify trend lines.

Tail Risk: A form of portfolio risk that arises when the possibility that an investment will move more than three standard deviations from the mean is greater than what is shown by a normal distribution.

### **Portfolio Data Derivatives Disclosures**

Average Portfolio Exposure, Largest Strategies by Average Exposure, Asset Class Exposure and Geographic Exposure weights reflect certain derivatives held in the portfolio (or their underlying reference assets) and may not total 100% or may be negative due to rounding, use of derivatives, unsettled trades or other factors.

#### What are the Kev Risks?

The value of shares in the Fund and income received from it can go down as well as up and investors may not get back the full amount invested.

Performance may also be affected by currency fluctuations. Currency fluctuations may affect the value of overseas investments.

The Fund invests directly or indirectly (through financial derivative instruments, structured products or collective investment schemes) in equity and fixed income securities, cash and equivalents, and (indirectly only) alternative investments (including commodities or property), with an aim to offer a balanced exposure between equities and debt securities over the long term. Such securities and investment instruments have historically been subject to price movements due to such factors as general stock market volatility, sudden changes in interest rates, changes in the financial outlook or perceived credit worthiness of securities issuers, or fluctuations in commodity prices or real estate values. As a result, the performance of the Fund can fluctuate over time.

The Fund may distribute income gross of expenses. Whilst this might allow more income to be distributed, it may also have the effect of reducing capital.

Other significant risks include: credit risk, currency risk, derivatives risk, liquidity risk, targeted return risk.

For full details of all of the risks applicable to this Fund, please refer to the "Risk Considerations" section of the Fund in the current prospectus of Franklin Templeton Investment Funds.

#### **Important Information**

As of 20.03.2015, all the assets of FTSAF–Franklin Strategic Balanced Fund were transferred into FTIF–Franklin Diversified Balanced Fund, a sub-fund especially created under FTIF to receive FTSAF–Franklin Strategic Balanced Fund's assets by way of merger. Such transfer of assets allowed FTIF–Franklin Diversified Balanced Fund to retain the past performance of the corresponding shares of FTSAF–Franklin Strategic Balanced Fund since inception.

In emerging markets, the risks can be greater than in developed markets. Investments in derivative instruments entail specific risks more fully described in the Fund's prospectus and, where available, in the relevant Key Investor Information Document. Currency fluctuations may affect the value of overseas investments. When investing in a fund denominated in a foreign currency, your performance may also be affected by currency fluctuations.

Issued by Franklin Templeton International Services, S.à r.l. Franklin Templeton Investment Funds (the "Fund") is a Luxembourg registered SICAV. Neither Morningstar nor its content providers are responsible for any damages or losses arising from any use of this information.

Negative Cash Weightings: The negative cash position reflects a temporary position that is a result of a delay in securities settlement transactions.

Fund Measures: The average credit quality (ACQ) rating may change over time. The portfolio itself has not been rated by an independent rating agency. The letter rating, which may be based on bond ratings from different agencies (or internal ratings for unrated bonds, cash and equivalents), is provided to indicate the average credit rating of the portfolio's underlying investments and generally ranges from AAA (highest) to D (lowest). For unrated bonds, cash and equivalents, ratings may be assigned based on the ratings of the issuer, the ratings of the underlying holdings of a pooled investment vehicle, or other relevant factors. The ACQ is determined by assigning a sequential integer to all credit ratings AAA to D, taking a simple, asset-weighted average of investments by market value and rounding to the nearest rating. The risk of default increases as a bond's rating decreases, so the ACQ provided is not a statistical measurement of the portfolio's default risk because a simple, weighted average does not measure the increasing level of risk from lower-rated bonds. The ACQ may be lower if cash and equivalents are excluded from the calculation. The ACQ is provided for informational purposes only. Derivative positions are not reflected in the ACQ.
